README

Libraries Required: - Express - Bcryptjs - jsonwebtoken - joi

Update1 : - This repository contains how to make a small database using REST API and MongoDB. Main features are: - It takes user data on signup request and stores it using MongoDB. - On sign in request, only the email and password are asked, verified and if verification is true, data about user is given back - On sign in, a token is generated for the user that is valid for 1 hour. If that token is copied and passed in the header as bearer token under authorisation, even then the information is given back
